
Sick & Tired after Upgrade not Working!!!

Posted by BossACI - 2008/05/21 23:55

:(Not happy at all!!!

After crashing and restoring several times, trying to upgrade Joomla,CB and MLS. I give up trying to upgrade to Joomla 1.0.13 from 1.0.7. I got the others done:

Community Builder 1.1 from some old one.

MyLanSite current from real old version that was working.

The problem I'm having now is in MLS...AND I HAVE BEEN READING FORUMS FOR THE LAST PAST MONTH!!!

Seatmap not editing, tournaments not working, and all the links related to them except room. Yes, I have uninstalled and re-installed still no luck. :angry:

Seatmap not able to place elements...

Tournaments not able to add anything, just returns not showing anything added.

So if you could point me in the right direction I would really appreciate it. My event is scheduled for July 12,2008.

Gamers are emailing me about registration.

This is an SOS!

Thanks in advance

Keith

So.. let's start with the basic.. What versions are you running of

- Joomla
- each myLANsite component
- CommunityBuilder

And: How did you get to these versions? Upgrade or direct install? If upgrade, how did you go about it? What versions did you upgrade _from_?

Hi moensch

Thanks for responding, I'm at wits end...

Joomla! 1.0.7 Stable 15-Jan-2006 20:00 UTC

Community Builder 1.1

MyLanSite:

Components

Catering 0.1.0

Events 0.1.6

Lang Class 0.0.3a

PayPal 0.1.1

Seatmap 0.1.2

Teams 0.1.3
Tournaments 0.1.5

Modules
Catering 0.0.1
Checklist 0.0.1
Eventmenu 0.0.2
Eventstatus 0.0.1

Original installation of Joomla.
Upgraded CB1.1 from 1.0

Now as for MLS all upgrade after upgrading CB.

I read your section about how to upgrade from older versions to the next version to be able to run the install.php. For the ones that were older I believe I patched them up using the xlm file by ftping the files to the proper location on my website. After checking each component, I used my admin tool to upload and install each component. I had one burp, but realized I had chosen the wrong file. Other than that all components uploaded and installed successfully. (Quick summary)

I know I missed a step somewhere, I just don't know where.

Thanks in advance

Keith
